

Reviewer-1

The article looks interesting and eligible for publication. Some minor changes are-

1. Please define number of participants (children) involved in the study. Is the two nurses are well qualified for illustrate the IMSM?
2. Yes, rating point is variable but visual analogue scale have some limitations like subjectivity, difficulty in comparing across individuals, potential for bias. Have you taken this in account?

Discussion and conclusion are very little. Can you elaborate your findings more?
